A review of the Paper Mulberry

(BROUSSONETIA PAPYRIFERA) (L.) HERT. EX VENT.

INTRODUCTION

This article is in a Personal Care series reviewing Far Eastern plants which are known for their use in traditional medicine and which have also been shown to be excellent in cosmetic and toiletry applications.

Paper Mulberry (Broussonetia papyrifera) (L.) Hert. ex Vent., is the second in this series. See Pueraria mirifica [Dweck, Personal Care, January 2003]

Family: Moraceae (Fig family).

Common names: Wauke, Poo'a'aha [Hawai'i]; U'a [Samoa] Chu (whole plant); Chu shi z (fruit); Gu shi (fruit); Chu tao (fruit) [China]; Paper Mulberry (English); Por-Gra-Saa, Por-Saa or Ton-Saa [Thailand]; Lu-a-Shu (Taiwan).

Synonyms: Papyrus papyrifera (L.)Kunth., Morus papyrifera (L.)

Description: Paper Mulberry is a small tree or shrub which grows naturally in Asian and Pacific countries such as Thailand, China, Myanmar, Laos, Japan, Korea, India and the southern USA.

Habitat: Thickets, mountain ravines and forests.

Chemical composition: (leaves, dried): 1.7% calcium carbonate; 4',7-Dihydroxyflavan Plant.; 4,0-Methylavidoside Plant.; 7-Hydroxy-4-methoxyflavan Plant.; Arsenic Fruit 0.62 ppm; Betulinic Acid Stem; Broussonetia Plant: Calcium Fruit 26,900 ppm; Copper Fruit 12 ppm; Iron Fruit 560 ppm; Kazinol Plant: Magnesium Fruit 4,030 ppm; Manganese Fruit 61 ppm; Mercury Fruit 0.06 ppm; Potassium Fruit 7,340 ppm; Saponin Fruit 5,000 ppm; Sodium Fruit 135 ppm; Zinc Fruit 23 ppm [Duve].

Broussonetia papyrifera was found to contain both calcium oxalate and calcium carbonate. The calcium oxalate crystals were mainly found as druses or prismatic crystals. Druses were located in the crystal cells of both mesophyll and bundle sheath, but prismatic crystals were found only in cells of the bundle sheath. All calcium carbonate crystals were located in the epidermal lithocysts, and the types of lithocysts were related to the number of epidermal layers, i.e. hair-like lithocysts in uniseriate epidermis and papilulate lithocysts in multiseriate epidermis [Wu et al.].

Broussonachine A [Cheng et al.] also [Wang et al].

Papyrilloflavonol A, a prenylated flavonol (5,7,3',4'-tetrahydroxy-6,5,4-di-(gamma,gamma-dimethylallyl)-flavonol) isolated from the root bark [Son et al.].

Papyrilloflavonol A (prenylated flavonol) [Kwaak et al.]; Two new compounds, 8-(1,1-dimethyallyl)-5-(3-methylbut-2-enyl)-3',4',5,7-tetrahydroxyflavanol (1), 3'-(3-methylbut-2-enyl)-3',4',7-trihydroxyflavane (2) and three known compounds 3,3',4',5,7-pentahydroxyflavone (3), uralenol (4), broussonachine A (5) were isolated from the roots [Chen et al.].

Broussonetolosides F and G, broussonetoside A and broussonoside A [Ko et al.]. Two new isoprenylated flavonoids, named broussonetoside F and G, were isolated from the root bark of B. papyrifera [collected from Taiwan] [Fang et al. 1995].

A new isoprenylated aurone, broussonaronone A, a novel isoprenylated flavon, broussonoside A, and butyrophenol acetate, erythraninsinate, kazinol A and B, and broussonachines A and B were isolated from the cortex of B. papyrifera, a Formosan medicinal plant collected from Kaohsiung, Taiwan [Fang et al. 1994].

Broussonarin A (2-[3-(4-hydroxyphenyl)propyl]-5-methoxyphenol) which was formerly reported as a phytocellin [Iida et al.]

5,7,2',4'-tetrahydroxy-3-geranyllavone, isogemischalcone C, 3'[3'-terma-hydroxymethyl]-E-gemischalcone (E)-gamma-methyl(E)-[2,4,2]',4'-tetrahydroxyflavanone 11'-O-coumarorate, demethylmoracin I, and (S)-2',4'-di-4'-hydroxy-2'-[4-(1-hydroxy-1-methyllethylidene)fluorofuro[2,3-b]flavanone, isolicificlavonol, (2S)-absinnone II, 5,7,2',4'-tetrahydroxy-6-geranyllavone, 5,7,3',4'-tetrahydroxy-3-methoxy-6-geranyllavone, (2S)-7,4'-di-4'-hydroxy-3'-prenyllavone, 1-(2',4'-di-4'-hydroxy-3-methoxyphenyl)-3-(4'-hydroxyphenyl)propene, 1-(2',4'-di-4'-hydroxy-3'-prenylphenyl)-3-(4'-hydroxyphenyl)propene, and 1-(4'-hydroxy-2'-methoxyphenyl)-3-(4'-hydroxy-3'-prenylphenyl)propene [Lee et al.].
Edible uses: Paper Mulberry can be used as a food for both human and animal consumption. The flower and young leaf of the variety *Broussonetia kurzii* has a protein content of 16-23%, together with nutrient minerals such as P, K, Ca and Mg and is suitable for human consumption.

The raw fruit. The fruit comprises a ball about 1.5 cm in diameter with numerous small edible fruits protruding — there is not much edible flesh but it has been reported to have a lovely flavour. Prolonged ingestion is said to weaken the bones.

The cooked leaves [Tanaka]. The dried leaf contains 1% calcium carbonate [Reid]. The leaves of *Broussonetia kurzii* are suitable for animal consumption and have 14 – 22% protein content.

Flowers: No more details.

Medicinal uses: Astringent; diaphoretic; diuretic; galactagogue (induces milk production); haemostatic; laxative; ophthalmic; skin; stimulant; stomachic; tonic; vulnerary.

It is said to be astringent, diuretic, tonic, vulnerary [Stuart]. The leaf juice is diaphoretic and a laxative — it is also used in the treatment of dysentery [Duke & Ayensu] and is also poulticed onto various skin disorders, bites etc. The authors also report that the stem bark is haemostatic and that the fruit is diuretic, ophthalmic, stimulant, stomachic and tonic. The root is cooked with other foods as a galactagogue.

The bark is decocted for ascites (abnormal build up of fluid in the abdomen) and is used to reduce swelling or oedema and used for abdominal distension. The juice is used in anuria (the inability to urinate).

Medically in Hawaii, the slimy sap of Paper Mulberry is a mild laxative. Thrush, a mouth disease, is said to be improved when the ash from the burned beaten sheet made from the bark is applied to the mouth.

Other uses include using the latex, which is said to be useful externally for neurodermatitis, tinea infection (a fungal disease of the skin or nails), eczema, bee sting, insect bites. Another use is as a vulnerary.

The leaves are employed for blood in sputum, vomiting blood, uterine bleeding, excess menstrual bleeding, bleeding wounds in Chinese medicine and for a bleeding stomach in Hawaii. The leaves are also said to be astringent in "fluxes" and gonorrhoea and are also used for dysentery, and enteritis. The sap is reported to remove pus in Chinese medicine. Leaves infused for stomach and abdominal pain according to Samoan folklore.

Western functions: Antidiarrheal, haemostatic.

Energetic functions: According to traditional Chinese medicine, Paper Mulberry tonifies the liver and kidneys, clears heat and cools the blood, drains dampness, clears damp heat in the middle and lower burners. It is also used to stop diarrhoea.

Chinese uses: Tonifies the liver and kidneys. Clears the vision, nourishes the eyes. It is used for debility of the legs and knees, blood deficiency, vertigo and impotence as well as weakness of joints and muscles.

Other uses: A fibre from the bark is used in making paper, cloth, rope etc. The fibre is produced by beating strips of bark on a flat surface with a wooden mallet. A very fine cloth can be made in this way, and the greater the beating of the bark the finer the cloth. Larger sizes of cloth are made by overlapping two sections of the bark and then beating them together. It is reported that a leather substitute can also be made from the bark. It has been known for almost 1,500 years as a plant whose bark can be used to make paper of various grades up to the highest quality. It is used in the production of flowers, umbrellas, fans, lanterns as well as lamps, dolls and toys, cloth and other items.

The tree also produces a natural dye that is green to yellow-green in colour, but the chemical responsible does not seem to have been determined.

Potential cosmetic uses: It appears to be a potent antioxidant [Cheng & al] and said to be as potent as butylated hydroxytoluene (BHT), a common antioxidant used for food preservation.

It may also be considered to have antifungal activity [Iida et al] because of the
compound identified as broussonetin A (2,3-(4-hydroxyphenyl)propyl)-5-methoxy phenol) which was formerly reported as a phytoalexin. There are other compounds that have been identified as having antibacterial properties, although none of these appear to have been commercially exploited.

**Skin depigmentation**

The depigmenting activity of Paper Mulberry has been measured using three colourimetric instruments [Ha et al]. They examined the effects of a tyrosinase inhibitor extracted from Broussonetia kaznakii x B. papyrifera and identified as Kazinol F with the same structure as shown in Fig.1. They reported that this material had the same level of tyrosinase inhibition activity at a lower concentration when compared with kojic acid, ascorbic acid and hydroquinone. They also reported that Kazinol F had a good free-radical scavenging activity compared to looopherol.

Skin depigmentation has been described by one author [D’Amello] using the root bark of Paper Mulberry. The active ingredient was described as 5-(3-(2,4-dihydroxypheryl)propyl)-3,4-bist(3-methyl-2-butenyl)-1,2-benzenediol.

The authors said that an extract of Paper Mulberry containing 5.0% of this active compound would be sufficient to show a fairly potent lightening effect when used at a concentration as low as 0.1-1.0% in the final product.

**Hazards**

None known. It has been reported that prolonged ingestion of the fruit will weaken the skeletal structure.
